

# Propositions of solutions for *Analysis I* by Terence Tao

Frédéric Santos

June 11, 2020

## 1. Introduction

No exercises in this chapter.

## 2. Starting at the beginning: the natural numbers

EXERCISE 2.2.1. — *Prove that the addition is associative, i.e. that for any natural numbers  $a, b, c$ , we have  $(a + b) + c = a + (b + c)$ .*

Let's use induction on  $c$  while keeping  $a$  and  $b$  fixed.

- Base case for  $c = 0$ : let's prove that  $(a + b) + 0 = a + (b + 0)$ . The left hand side is equal to  $(a + b)$  according to Lemma 2.2.3. For the right hand side, if we apply the same lemma to the  $(b + 0)$  part, we get  $a + (b + 0) = a + b$ . Both sides are equal to  $a + b$ , and the base case is thus done.
- Now let's suppose inductively that  $(a + b) + c = a + (b + c)$ : we have to prove that  $(a + b) + c++ = a + (b + c++)$ . Using Lemma 2.2.3 on the right hand side leads to  $a + (b + c)++$ . Now consider the left hand side. Using still the same lemma, we get  $(a + b) + c++ = ((a + b) + c)++$ . By the inductive hypothesis, this is also equal to  $(a + (b + c))++$ . And, using the lemma 2.2.3 again, this also leads to  $a + b + c++$ . Therefore, both sides are equal to  $a + b + c++$ , and we have closed the induction.

EXERCISE 2.2.2. — *Let  $a$  be a positive number. Prove that there exists exactly one natural number  $b$  such that  $b++ = a$ .*

Let's use induction on  $a$ .

- Base case for  $a = 1$ : we know that  $b = 0$  matches this property, since  $0++ = 1$  by Definition 2.1.3. Furthermore, there is only one solution. Suppose that is another natural number  $b$  such that  $b++ = 1$ . Then, we would have  $b++ = 0++$ , which would imply  $b = 0$  by Axiom 2.4. The base case is demonstrated.
- Let's suppose inductively that there is exactly one natural number  $b$  such that  $b++ = a$ . We have to prove that there is exactly one natural number  $b'$  such that  $b'++ = a++$ . By the induction hypothesis, and taking  $b' = b++$ , we have  $b'++ = (b++)++ = a++$ . So there exists a solution, with  $b' = b++ = a$ . Uniqueness is given by Axiom 2.4.: if  $b'++ = a++$ , then we necessarily have  $b' = a$ .

EXERCISE 2.2.3. — Let  $a, b, c$  be natural numbers. Prove the following properties of order for natural numbers:

- (a) Reflexivity:  $a \geq a$ . This is true since  $a = 0 + a$  by Definition 2.2.1. By commutativity of addition, we can also write  $a = a + 0$ . So there is indeed a natural number  $n$  (with  $n = 0$ ) such that  $a = a + n$ , i.e.  $a \geq a$ .
- (b) Transitivity: if  $a \geq b$  and  $b \geq c$ , then  $a \geq c$ . From the part  $a \geq b$ , there exists a natural number  $n$  such that  $a = b + n$  according to Definition 2.2.11. A similar consideration for the part  $b \geq c$  leads to  $b = c + m$ ,  $m$  being a natural number. Combining together those two equalities, we can write  $a = b + n = (c + m) + n = c + (m + n)$  by associativity (see Exercise 2.2.1). Then,  $n + m$  being a natural number<sup>1</sup>, the transitivity is demonstrated.
- (c) Anti-symmetry: if  $a \geq b$  and  $b \geq a$ , then  $a = b$ . From the part  $a \geq b$ , there exists a natural number  $n$  such that  $a = b + n$ . Similarly, there exists a natural number  $m$  such that  $b = a + m$ . Combining those two equalities leads to  $a = b + n = (a + m) + n = a + (m + n)$ . By cancellation law (Proposition 2.2.6), we can conclude that  $0 = m + n$ . According to Corollary 2.2.9, this leads to  $m = n = 0$ . Therefore, both  $m$  and  $n$  are null, meaning that  $a = b + 0 = b$ .
- (d) Preservation of order:  $a \geq b$  iff  $a + c \geq b + c$ . First, let's prove that  $a + c \geq b + c \implies a \geq b$ . If  $a + c \geq b + c$ , there exists a natural number  $n$  such that  $a + c = b + c + n$ . By cancellation law (Proposition 2.2.6)<sup>2</sup>, we conclude that  $a = b + n$ , i.e.  $a \geq b$ , thus demonstrating the first implication. Conversely, let's suppose that  $a \geq b$ . There exists a natural number  $m$  such that  $a = b + m$ . Therefore,  $a + c = b + m + c$  for any natural number  $c$ . Still by associativity and commutativity, we can rewrite this as  $a + c = (b + c) + m$ , i.e.  $a + c \geq b + c$ .
- (e)  $a < b$  iff  $a++ \leq b$ . First, let's prove that  $a++ \leq b \implies a < b$ . By definition of ordering, there exists a natural number  $n$  such that  $b = (a++) + n$ . By definition of addition, we can re-write:  $b = (a++ + n)++$ . Then, by commutativity and yet again by definition of addition,  $b = (n + a++)++ = (n++) + (a++)$ . Thus, there exists a natural number  $n++$  such that  $b = n++ + a$ , which means that  $b \geq a$ . But we still have to prove that  $a \neq b$ . Let's suppose that  $a = b$ : in this case, by cancellation law, we would have  $n++ = 0$ , which is impossible according to Axiom 2.3 (0 is not the successor of any natural number). Thus,  $a \neq b$  et  $b \geq a$ : we have showed that  $a < b$ .  
Conversely, let's prove that  $a < b \implies a++ \leq b$ . Starting from that strict inequality, there exists a *positive*<sup>3</sup> natural number  $n$  such that  $b = a + n$ . By Lemma 2.2.10, since  $n$  is positive, it has one unique antecessor  $m$ , so that  $n$  can be written  $m++$ . Thus,  $b = a + (m++) = (a + m)++ = (m + a)++ = m + (a++) = (a++) + m$ . And,  $m$  being a natural number, this corresponds to the statement  $b \geq a$ .
- (f)  $a < b$  iff  $b = a + d$  for some positive number  $d$ . First, let's prove the first implication,  $a < b \implies b = a + d$  with  $d \neq 0$ . Since  $a < b$ , we have in particular  $a \leq b$ , and

<sup>1</sup>This is a trivial induction from the definition of addition.

<sup>2</sup>And also associativity and commutativity that we do not detail explicitly here.

<sup>3</sup>We make use here of the statement (f) demonstrated below. There is no circularity here, since proving (f) will not make use of (e).

there exists a natural number  $d$  such that  $b = a + d$ . For the sake of contradiction, let's suppose that  $d = 0$ . We would have  $b = a$ , which would contradict the condition  $a \neq b$  of the strict inequality. Thus,  $d$  is a positive number, which demonstrates the left-to-right implication.

Conversely, let's suppose that  $b = a + d$ , with  $d \neq 0$ . This expression gives immediately  $a \leq b$ . But if  $a = b$ , by cancellation law, this would lead to  $0 = d$ , a contradiction with the fact that  $d$  is a positive number. Thus,  $a \neq b$  and  $a \leq b$ , which demonstrates  $a < b$ .

**EXERCISE 2.2.4.** — *Demonstrate three lemmas used to prove the trichotomy of order for natural numbers.*

- (a) Show that we have  $0 \leq b$  for any natural number  $b$ . This is obvious since, by definition of addition,  $0 + b = b$  for any natural number  $b$ . This is precisely the definition of  $0 \leq b$ .
- (b) Show that if  $a > b$ , then  $a++ > b$ . If  $a > b$ , then  $a = b + d$ ,  $d$  being a positive natural number. Let's recall that  $a++ = a + 1$ . Thus,  $a++ = a + 1 = b + d + 1 = b + (d + 1)$  by associativity of addition. Furthermore,  $d + 1$  is a positive natural number (by Proposition 2.2.8). Thus,  $a++ > b$ .
- (c) Show that if  $a = b$ , then  $a++ > b$ . Once again, let's use the fact that  $a++ = a + 1$ . Thus,  $a++ = a + 1 = b + 1$ , and 1 is a positive natural number. This is the definition of  $a++ > b$ .

**EXERCISE 2.2.5.** — *Prove the strong principle of induction, formulated as follows: Let  $m_0$  be a natural number, and let  $P(m)$  be a property pertaining to an arbitrary natural number  $m$ . Suppose that for each  $m \geq m_0$ , we have the following implication: if  $P(m')$  is true for all natural numbers  $m_0 \leq m' < m$ , then  $P(m)$  is also true. (In particular, this means that  $P(m_0)$  is true, since in this case the hypothesis is vacuous.) Then we can conclude that  $P(m)$  is true for all natural numbers  $m \geq m_0$ .*

First let's introduce a small lemma (similar to Proposition 2.2.12(e)).

**Lemma.** *For any natural number  $a$  and  $b$ ,  $a < b++$  iff  $a \leq b$ .*

*Proof.* If  $a < b++$ , then  $b++ = a + n$  for a given positive natural  $n$ . By Lemma 2.2.10, there exists one natural number  $m$  such as  $n = m++$ . Thus  $b++ = a + m++$ , which can be rewritten  $b++ = (a + m)++$  by Lemma 2.2.3<sup>4</sup>. By Axiom 2.4., this is equivalent to  $b = a + n$ , which can also be written  $a \leq b$ .

Conversely, if  $a \leq b$ , there exists a natural number  $m$  such as  $b = a + m$ . Thus,  $b++ = (a + m)++ = a + (m++)$  by Definition of addition (2.2.1). And,  $m++$  being a positive number, this means that  $b > a$  according to Proposition 2.2.12(f).  $\square$

Now we can prove the main proposition. Let  $Q(n)$  be the property " $P(m)$  is true for all  $m$  such that  $m_0 \leq m < n$ ". Let's induct on  $n$ .

- (Although this is not necessary,) we could consider two types of base cases. If  $n < m_0$ ,  $Q(n)$  is the proposition " $P(m)$  is true for all  $m$  such that  $m_0 \leq m < n$ ", but there is no such natural number  $m$ . Thus,  $Q(n)$  is vacuously true. If  $n = m_0$ ,  $P(m_0)$  is true by hypothesis, thus  $Q(m_0)$  is also true.

---

<sup>4</sup>We could also rewrite  $b + 1 = a + m + 1$  and then use the cancellation law.

- Now let's suppose inductively that  $Q(n)$  is true, and show that  $Q(n++)$  is also true. If  $Q(n)$  is true,  $P(m)$  is true for all  $m$  such that  $m_0 \leq m < n$ . By hypothesis, this implies that  $P(n)$  is true. Thus,  $P(m)$  is true for any natural number  $m$  such that  $m_0 \leq m \leq n$ , i.e. such that  $m_0 \leq m < n++$  according to the lemma introduced above. This is precisely  $Q(n++)$ , and this closes the induction.

Thus,  $Q(n)$  is true for all natural numbers  $n$ , which means in particular that  $P(m)$  is true for any natural number  $m \geq m_0$ . This demonstrates the principle of strong induction.

EXERCISE 2.2.6. — *Let  $n$  be a natural number, and let  $P(m)$  be a property pertaining to the natural numbers such that whenever  $P(m++)$  is true, then  $P(m)$  is true. Suppose that  $P(n)$  is also true. Prove that  $P(m)$  is true for all natural numbers  $m \leq n$ ; this is known as the principle of backwards induction.*

Terence Tao suggests to use induction on  $n$ . So let  $Q(n)$  be the following property: “if  $P(n)$  is true, then  $P(m)$  is true for all  $m \leq n$ ”. The goal is to prove  $Q(n)$  for all natural numbers  $n$ .

- Base case  $n = 0$ : here,  $Q(n)$  means that if  $P(0)$  is true, then  $P(m)$  is true for any  $m \leq 0$ . By Definition 2.2.11, if  $m \leq 0$ , there exists a natural number  $d$  such that  $0 = m + d$ . But, by Corollary 2.2.9, this implies that both  $m = 0$  and  $d = 0$ . Thus, the only number  $m$  such that  $m \leq 0$  is 0 itself. Therefore,  $Q(0)$  is simply the tautology “if  $P(0)$  is true, then  $P(0)$  is true”—a statement that we can safely accept. The base case is the, demonstrated.
- Let's suppose inductively that  $Q(n)$  is true: we must show that  $Q(n++)$  is also true. If  $P(n++)$  is true, then by definition of  $P$ ,  $P(n)$  is also true. Then, by induction hypothesis,  $P(m)$  is true for all  $m \leq n$ . We have showed that  $P(n++)$  implies  $P(m)$  for all  $m \leq n++$ <sup>5</sup>, which is precisely  $Q(n++)$ . This closes the induction.

EXERCISE 2.3.1. — *Show that multiplication is commutative, i.e., if  $n$  and  $m$  are natural numbers, show that  $n \times m = m \times n$ .*

We will use an induction of  $n$  while keeping  $m$  fixed. However, this is not a trivial result, and even the base case is not straightforward. We will first introduce some lemmas.

**Lemma.** *For any natural number  $n$ ,  $n \times 0 = 0$ .*

*Proof.* Let's induct on  $n$ . For the base case  $n = 0$ , we know by Definition 2.3.1 of multiplication that  $0 \times 0 = 0$ , since  $0 \times m = 0$  for any natural number  $m$ .

Now let's suppose that  $n \times 0 = 0$ . Thus,  $n++ \times 0 = (n \times 0) + 0$  by Definition 2.3.1. But by induction hypothesis,  $n \times 0 = 0$ , so that  $n++ \times 0 = 0 + 0 = 0$ . This closes the induction.  $\square$

**Lemma.** *For all natural numbers  $m$  and  $n$ , we have  $m \times n++ = (m \times n) + m$ .*

---

<sup>5</sup>Actually, we use here yet another lemma, similar to the one introduced for the previous exercise. We use the fact that  $m \leq n++$  is equivalent to  $m = n++$  or  $m \leq n$ , which is easy to prove, but is not part of the “standard” results presented in the textbook.

*Proof.* Let's induct on  $m$ . The base case  $m = 0$  is easy to prove:  $0 \times n++ = 0$  by Definition 2.3.1 of multiplication, and  $(0 \times n) + 0 = 0$ .

Now suppose inductively that  $m \times n++ = (m \times n) + m$ , and we must show that

$$m++ \times n++ = (m++ \times n) + m++ \quad (1)$$

We begin by the left hand side: by Definition 2.3.1,  $m++ \times n++ = (m \times n++) + n++$ . By induction hypothesis, this is equal to  $(m \times n) + m + n++$ .

Then, apply the definition of multiplication to the right hand side:  $(m++ \times n) + m++ = (m \times n) + n + m++$ . The Lemma 2.2.3 and the commutativity of addition leads to  $(m \times n) + n + m++ = (m \times n) + (n + m)++ = (m \times n) + (m + n)++ = (m \times n) + m + n++$ , which is equal to the left hand side.

Thus, both sides of equation (1) are equal, and we can close the induction.  $\square$

Now it is easier to prove the main result ( $n \times m = m \times n$ ), by an induction on  $n$ .

- Base case  $n = 0$ : we already know by Definition 2.3.1 that  $0 \times m = 0$ . The first lemma introduced in this exercise also provides  $m \times 0 = 0$ . Thus, the base case is proved, since  $0 \times m = m \times 0 (= 0)$ .
- Now we suppose inductively that  $n \times m = m \times n$ , and we must prove that:

$$n++ \times m = m \times n++ \quad (2)$$

By Definition 2.3.1 of multiplication, the left hand side is equal to  $(n \times m) + m$ .

Using the lemma introduced above, the right hand side is equal to  $(m \times n) + m$ . By induction hypothesis, this is also equal to  $(n \times m) + m$ , which closes the induction.

**EXERCISE 2.3.2.** — *Show that positive natural numbers have no zero divisors, i.e. that  $nm = 0$  iff  $n = 0$  or  $m = 0$ . In particular, if  $n$  and  $m$  are both positive, then  $nm$  is also positive.*

We will prove the second statement first. Suppose, for the sake of contradiction, that  $nm = 0$  and that both  $n$  and  $m$  are positive numbers. Since they are positive, by Lemma 2.2.10, there exists two (unique) natural numbers  $a$  and  $b$  such that  $n = a++$  and  $m = b++$ . Thus, the hypothesis  $nm = 0$  can also be written  $(a++) \times (b++) = 0$ . But, by Definition 2.3.1 of multiplication,  $(a++) \times (b++) = (a \times b++) + b++$ . Thus, we should have  $(a \times b++) + b++ = 0$ . By Corollary 2.2.9, this implies that both  $(a \times b++) = 0$  and  $b++ = 0$ , which is impossible since zero is the successor of no natural number (Axiom 2.3).

Thus, we have proved that if  $n$  and  $m$  are both positive, then  $nm$  is also positive. The main statement can now be proved more easily.

- The right-to-left implication is straightforward: if  $n = 0$ , then by Definition of multiplication,  $n \times m = 0 \times m = 0$ . Since multiplication is commutative, we have the same result if  $m = 0$ .
- The left-to-right implication is exactly the contrapositive of the statement we have just proved above.

EXERCISE 2.3.3. — *Show that multiplication is associative, i.e., for any natural numbers  $a, b, c$ , we have  $(a \times b) \times c = a \times (b \times c)$ .*

We will induct on  $c$  while keeping  $a$  and  $b$  fixed.

- Base case: for  $c = 0$ , we must prove that  $(a \times b) \times 0 = a \times (b \times 0)$ . The left hand side is equal to 0 by definition (and commutativity) of multiplication<sup>6</sup>. The right hand side is equal to  $a0$ , which is also 0. Both sides are null, and the base case is proved.
- Suppose inductively that  $(a \times b) \times c = a \times (b \times c)$ , and let's prove that  $(a \times b) \times c++ = a \times (b \times c++)$ . By definition (and commutativity) of multiplication, the left hand side is equal to  $(a \times b) \times c + (a \times b)$ . The right hand side is equal to  $a \times (b \times c + b)$ , and by distributive law (i.e., Proposition 2.3.4), this is also  $a \times (b \times c) + a \times b$ . But then, by inductive hypothesis, this can be rewritten  $(a \times b) \times c + a \times b$ , which is equal to the left hand side. The induction is closed.

EXERCISE 2.3.4. — *Prove the identity  $(a + b)^2 = a^2 + 2ab + b^2$  for all natural numbers  $a, b$ .*

By distribution law (i.e., Proposition 2.3.4) and commutativity of multiplication, we have:

$$\begin{aligned}(a + b)^2 &= (a + b)(a + b) = (a + b)a + (a + b)b \\ &= a \times a + b \times a + a \times b + b \times b \\ &= a^2 + a \times b + a \times b + b^2 \\ &= a^2 + 2ab + b^2\end{aligned}$$

(For the last step, we recall that, by Definition 2.3.1,  $2 \times m = m + m$  for any natural number  $m$ .)

EXERCISE 2.3.5. — *Euclidean algorithm. Let  $n$  be a natural number, and let  $q$  be a positive number. Prove that there exists natural numbers  $m, r$  such that  $0 \leq r < q$  and  $n = mq + r$ .*

We will induct on  $n$  while remaining  $q$  fixed.

- Base case: if  $n = 0$ , there exists an obvious solution, namely  $m = 0$  and  $r = 0$ .
- Suppose inductively that there exists  $m, r$  such that  $n = mq + r$  with  $0 \leq r < q$ , and let's prove that there exists  $m', r'$  such that  $n + 1 = m'q + r'$ , with  $0 \leq r' < q$ .

By the induction hypothesis, we have  $n + 1 = mq + r + 1$ . Since  $r < q$ , we have  $r + 1 \leq q$  (this is Proposition 2.2.12). Thus, we have two cases here:

1. If  $r + 1 < q$ , then  $n + 1 = mq + (r + 1)$ , with  $0 \leq r + 1 < q$ , so that choosing  $m' = m$  and  $r' = r + 1$  is convenient.
2. If  $r + 1 = q$ , then  $n + 1 = mq + q = (m + 1)q$  according to the distributive law (Proposition 2.3.4). Thus, choosing  $m' = m + 1$  and  $r' = 0$  is convenient.

This closes the induction.

---

<sup>6</sup>Actually, we use the second lemma introduced for the resolution of Exercise 2.3.1.

### 3. Set theory

EXERCISE 3.1.2. — *Using only Definition 3.1.4, Axiom 3.1, Axiom 3.2, and Axiom 3.3, prove that the sets  $\emptyset$ ,  $\{\emptyset\}$ ,  $\{\{\emptyset\}\}$ , and  $\{\emptyset, \{\emptyset\}\}$  are all distinct (i.e., no two of them are equal to each other).*

As a general reminder, we recall that sets are objects (Axiom 3.1) and the empty set  $\emptyset$  is such that no object is an element of  $\emptyset$ , thus  $\emptyset \notin \emptyset$ .

1. First let's show that  $\emptyset$  is different from all other sets.  $\emptyset$  is an element of  $\{\emptyset\}$  and  $\{\emptyset, \{\emptyset\}\}$ , and  $\{\emptyset\}$  is an element of  $\{\{\emptyset\}\}$ . But none of those two objects are elements of  $\emptyset$  (by Axiom 3.2), thus  $\emptyset$  is different from all three other sets.
2. Then let's show that  $\{\emptyset\} \neq \{\{\emptyset\}\}$ . By Axiom 3.3, the singleton  $\{\emptyset\}$  is such that  $x \in \{\emptyset\} \iff x = \emptyset$ . Similarly, the singleton  $\{\{\emptyset\}\}$  is such that  $x \in \{\{\emptyset\}\} \iff x = \{\emptyset\}$ . But we already know that  $\emptyset \neq \{\emptyset\}$  so there exists an object,  $\emptyset$ , which is a element of  $\{\emptyset\}$  but not an element of  $\{\{\emptyset\}\}$ . Those sets are not equal.
3. Now let's show that  $\{\emptyset\} \neq \{\emptyset, \{\emptyset\}\}$ . By Axiom 3.3, the pair  $\{\emptyset, \{\emptyset\}\}$  is such that  $x$  is an element of this set iff  $x = \emptyset$  or  $x = \{\emptyset\}$ . Thus,  $\{\emptyset\}$  is an element of  $\{\emptyset, \{\emptyset\}\}$ , but is not an element of  $\{\emptyset\}$  (if it was, we should have  $\emptyset = \{\emptyset\}$ , which would be a contradiction with the first point of this proof). Those two sets are thus different.
4. Finally, we also have  $\{\{\emptyset\}\} \neq \{\emptyset, \{\emptyset\}\}$ . Indeed, we have  $\emptyset \in \{\emptyset, \{\emptyset\}\}$  by Axiom 3.3. However,  $\emptyset \in \{\{\emptyset\}\} \iff \emptyset = \{\emptyset\}$  by definition of a singleton, and we know this latest statement is false by the first point of this proof. Those two sets are also different.

EXERCISE 3.1.3. — *Prove the remaining claims in Lemma 3.1.13.*

Those claims are the following:

1.  $\{a, b\} = \{a\} \cup \{b\}$ . By Axiom 3.3, the pair  $\{a, b\}$  is such that  $x \in \{a, b\} \iff x = a$  or  $x = b$ . Let's consider three cases:
  - if  $x = a$ ,  $x \in \{a\}$  by Axiom 3.3, thus  $x \in \{a\} \cup \{b\}$  by Axiom 3.4
  - if  $x = b$ ,  $x \in \{b\}$  by Axiom 3.3, thus  $x \in \{a\} \cup \{b\}$  by Axiom 3.4
  - if  $x \neq a$  and  $x \neq b$ ,  $x \notin \{a\}$  and  $x \notin \{b\}$  by Axiom 3.3, so that  $x \notin \{a\} \cup \{b\}$

Thus,  $\{a, b\}$  and  $\{a\} \cup \{b\}$  have the same elements, and are equal.

2.  $A \cup B = B \cup A$  for all sets  $A$  and  $B$ . Indeed,  $x \in A \cup B \iff x \in A$  or  $x \in B$ . If  $x \in A$ , then  $x \in B \cup A$  by Axiom 3.4. A similar argument holds if  $x \in B$ . Thus, in both cases,  $x \in B \cup A$ . We can show in a similar fashion that any element of  $B \cup A$  is in  $A \cup B$ .
3.  $A \cup \emptyset = \emptyset \cup A = A$ . Since we've just showed that union is commutative, proving  $A \cup \emptyset = A$  is sufficient. If  $x \in A$ , then  $x \in A \cup \emptyset$ . The converse is also true: if  $x \in A \cup \emptyset$ , then  $x \in A$  or  $x \in \emptyset$ . But there is no element in  $\emptyset$ , so that we have necessarily  $x \in A$ . Thus,  $A \cup \emptyset$  and  $A$  have the same elements: they are equal.

EXERCISE 3.1.4. — *Prove the remaining claims from Proposition 3.1.18.*

Let  $A, B, C$  be sets. Those claims are the following:

1. If  $A \subseteq B$  and  $B \subseteq A$ , then  $B = A$ . According to Definition 3.1.4, two sets  $A$  and  $B$  are equal iff every element of  $A$  is an element of  $B$ , and vice versa. This is precisely the present claim.
2. If  $A \subsetneq B$  and  $B \subsetneq C$ , then  $A \subsetneq C$ . Let  $x$  be an element of  $A$ . Since  $A \subsetneq B$ ,  $x$  is also an element of  $B$ . And since  $B \subsetneq C$ ,  $x$  is also an element of  $C$ . This holds for any  $x$  in  $A$ , and thus it demonstrates that  $A \subset C$ . Furthermore, since  $A \subsetneq B$ , there exists an element  $y \in B$  which is not an element of  $A$ . As  $B \subsetneq C$ ,  $y$  is also an element of  $C$ . Thus we have  $y$ , an element of  $C$  which is not in  $A$ . Combined to the previous result  $A \subset C$ , this demonstrates  $A \subsetneq C$ .

EXERCISE 3.1.5. — *Let  $A, B$  be sets. Show that the three statements  $A \subseteq B$ ,  $A \cup B = B$  and  $A \cap B = A$  are logically equivalent (i.e., any one of them implies the other two).*

1. First, we prove that  $A \subseteq B \implies A \cup B = B$ . The first inclusion  $B \subseteq A \cup B$  is trivial, since any element of a set  $B$  is always either in  $A$  or  $B$ . For the converse inclusion, let  $x$  be an element of  $A \cup B$ , and let's prove that  $x \in B$ . By Axiom 3.4, we have  $x \in A$  or  $x \in B$ . If  $x \in B$ , the result holds. If  $x \in A$ , then we also have  $x \in B$  since  $A \subseteq B$ . Thus, any element of  $A \cup B$  is an element of  $B$ , which demonstrates the equality  $A \cup B = B$ .
2. Then, we prove that  $A \cup B = B \implies A \cap B = A$ . The first inclusion is trivial: if  $x \in A \cap B$ , then we always have  $x \in A$ . Now let's prove the converse inclusion: let  $x$  be an element of  $A$ ; we must show that  $x \in A \cap B$ . If  $x \in A$ , then  $x \in A \cup B$ . But, by hypothesis,  $A \cup B = B$ , thus  $x \in B$ . So,  $x \in A$  and  $x \in B$ , i.e.  $x \in A \cap B$ . This demonstrates the implication.
3. Finally, we prove that  $A \cap B = A \implies A \subseteq B$ . Let  $x \in A$ . Since  $A \cap B = A$ , we have  $x \in A \cap B$ . It follows that  $x \in B$ . We have proved that any element  $x \in A$  is also an element of  $B$ , i.e.  $A \subseteq B$ .

EXERCISE 3.1.8. — *Let  $A, B$  be sets. Prove the absorption laws  $A \cap (A \cup B) = A$  and  $A \cup (A \cap B) = A$ .*

1. The first inclusion  $A \cap (A \cup B) \subseteq A$  is trivial: if  $x \in A \cap (A \cup B)$  then in particular  $x \in A$  by Definition 3.1.23 of an intersection<sup>7</sup>. Thus, we have  $A \cap (A \cup B) \subseteq A$ .

For the converse inclusion, let  $x$  be an element of  $A$ . Then by definition  $x \in A$ , and we have also  $x \in A \cup B$  since  $x \in A$ . Thus,  $x \in A \cap (A \cup B)$ , which proves the converse inclusion.

Consequently,  $A = A \cap (A \cup B)$ .

2. First we show that  $A \cup (A \cap B) \subseteq A$ . Let  $x \in A \cup (A \cap B)$ . By Definition of an union, we have either  $x \in A$ , or  $x \in A \cap B$ . In both cases<sup>8</sup>, we have  $x \in A$ , so that the inclusion is proved.

<sup>7</sup>This intersection is not empty since  $A$  and  $A \cup B$  are not disjoint.

<sup>8</sup>If  $A$  and  $B$  are disjoint, then the first case  $x \in A$  necessarily holds, since  $x \in A \cup B$  is impossible.

Conversely, let  $x \in A$ . Then in particular, we have  $x \in A \cup (A \cap B)$  by Definition of an union, because  $x \in A$ . Thus,  $x \in A \cup (A \cap B)$ .

We have proved that  $A \cup (A \cap B) = A$ .

EXERCISE 3.1.9. — *Let  $A, B, X$  be sets such that  $A \cup B = X$  and  $A \cap B = \emptyset$ . Show that  $A = X \setminus B$  and  $B = X \setminus A$ .*

The two sets  $A$  and  $B$  play a symmetrical role here, so that proving one of these two assertions is sufficient. For instance, we prove that  $A = X \setminus B$ .

- Let  $x$  be an element of  $A$ . Since  $x \in A$ , we also have  $x \in A \cup B$  by definition of an union. But  $A \cup B = X$ , and then  $x \in X$ . On the other hand, we cannot have  $x \in B$ , because  $x \in A$  and the sets  $A, B$  are disjoint. Thus,  $x \in X$  and  $x \notin B$ , which means that  $x \in X \setminus B$ . We have proved that  $A \subseteq X \setminus B$ .
- Conversely, let  $x$  be an element of  $X \setminus B$ . By definition, this means that  $x \in X$ , i.e.  $x \in A \cup B$ , and  $x \notin B$ . Since  $x \in A \cup B$ , we have either  $x \in A$  or  $x \in B$ , but we know that the latter is impossible. Thus, we have necessarily  $x \in A$ . We have proved that  $X \setminus B \subseteq A$ .
- We can conclude that  $X \setminus B = A$ .

EXERCISE 3.1.11. — *Prove that the axiom of replacement (Axiom 3.6) implies the axiom of specification (Axiom 3.5).*

Let's recall the axiom of replacement. Let  $A$  be a set. For every  $x \in A$ , and for every (abstract) object  $y$ , let  $P(x, y)$  be a statement pertaining to both  $x$  and  $y$ , such that for any  $x \in A$  there is at most one  $y$  for which  $P(x, y)$  is true. Then there exists a set  $\{y : P(x, y) \text{ is true for some } x \in A\}$ , such that for any object  $z$ ,

$$z \in \{y : P(x, y) \text{ is true for some } x \in A\} \iff P(x, z) \text{ is true for some } x \in A$$

Now, let  $A$  be a set,  $x$  an element of  $A$ , and  $y$  an object. We accept the axiom of replacement, and show that it implies the axiom of specification.

Let  $Q(x, y)$  be the property " $x = y$  and  $P(x)$ ". According to the axiom of replacement, there exists a set  $\{y : Q(x, y) \text{ is true for some } x \in A\}$  such that:

$$\begin{aligned} & z \in \{y : Q(x, y) \text{ is true for some } x \in A\} \\ \iff & Q(x, z) \text{ is true for some } x \in A \\ \iff & x = z \text{ and } P(x) \text{ is true for some } x \in A \\ \iff & x = z \text{ and } P(z) \text{ is true for some } x \in A \text{ (by axiom of substitution)} \\ \iff & z \in A \text{ and } P(z) \text{ is true} \end{aligned}$$

Thus, we have proved the existence of a set (the set  $\{y : Q(x, y) \text{ is true for some } x \in A\}$ ) satisfying the axiom of specification:  $z$  belongs to this set iff  $z \in A$  and  $P(z)$  is true.

EXERCISE 3.3.1. — *Show that the definition of equality in Definition 3.3.7 is reflexive, symmetric and transitive. Also verify the substitution property: if  $f_1, f_2 : X \rightarrow Y$  and  $g_1, g_2 : Y \rightarrow Z$  are functions such that  $f_1 f_2$  and  $g_1 = g_2$ , then  $g_1 \circ f_1 = g_2 \circ f_2$ .*

1. Definition 3.3.7 says that two functions  $f$  and  $g$  are equal if they have same domain  $X$  and range  $Y$ , and if, for all  $x \in X$ ,  $f(x) = g(x)$ . This definition of equality is obviously reflexive, symmetric and transitive if we assume that the objects in the domain  $X$  and the range  $Y$  verify themselves the axioms of equality.
2. Since  $f_1 = f_2$ , they have same domain  $X$  and same range  $Y$ . This is also the case for  $g_1$  and  $g_2$ , with domain  $Y$  and range  $Z$ . Thus,  $g_1 \circ f_1$  has domain  $X$  and range  $Z$ , and so has  $g_2 \circ f_2$ . Furthermore, we have, for all  $x \in X$ :

$$\begin{aligned} g_2 \circ f_2(x) &= g_2 \circ f_1(x) \text{ (since } f_1 = f_2) \\ &= g_1 \circ f_1(x) \text{ (since } g_1 = g_2) \end{aligned}$$

which closes the demonstration.

EXERCISE 3.3.2. — *Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  be functions. Show that if  $f$  and  $g$  are both injective, then so is  $g \circ f$ . Similarly, show that if  $f$  and  $g$  are both surjective, then so is  $g \circ f$ .*

First let's note that  $g \circ f : X \rightarrow Z$ .

1. Suppose that  $f$  and  $g$  are both injective, and let  $x, x' \in X$ . We have successively :

$$\begin{aligned} g \circ f(x) &= g \circ f(x') \\ g(f(x)) &= g(f(x')) \\ f(x) &= f(x') \text{ because } g \text{ is injective} \\ x &= x' \text{ because } f \text{ is injective} \end{aligned}$$

We have showed that  $g \circ f(x) = g \circ f(x') \Rightarrow x = x'$  for all  $x, x' \in X$ , i.e. that  $g \circ f$  is injective.

2. Suppose that  $f$  and  $g$  are both surjective, and let be  $z \in Z$ . Since  $g$  is surjective, there exists  $y \in Y$  such that  $z = g(y)$ . And since  $f$  is surjective, there exists  $x \in X$  such that  $y = f(x)$ . Thus, combining those two results, there exists  $x \in X$  such that  $z = g(f(x))$ . This means precisely that  $g \circ f$  is surjective.

EXERCISE 3.3.3. — *When is the empty function injective? surjective? bijective?*

Let  $f$  be the empty function, i.e.  $f : \emptyset \rightarrow Y$  for a certain range  $Y$ .

1.  $f$  is injective iff  $x \neq x' \Rightarrow f(x) \neq f(x')$ . This can be considered as vacuously true since there are no such  $x$  and  $x'$ .  $f$  can be considered as always injective, for any range  $Y$ .
2.  $f$  is surjective iff for any  $y \in Y$ , there exists  $x \in \emptyset$  such that  $y = f(x)$ . We can clearly see that this assertion is false if  $Y \neq \emptyset$ , since any  $y \in Y$  will have no antecedent in  $\emptyset$ . Conversely, if  $Y = \emptyset$ , the assertion is vacuously true, since there is no element in  $Y$ . Thus,  $f$  is surjective iff  $Y = \emptyset$ .
3. Since  $f$  is always injective, and is surjective iff  $Y = \emptyset$ , it is clear that  $f$  is bijective iff  $Y = \emptyset$ .

EXERCISE 3.3.4. — Let  $f : X \rightarrow Y$ ,  $\tilde{f} : X \rightarrow Y$ ,  $g : Y \rightarrow Z$ ,  $\tilde{g} : Y \rightarrow Z$  be functions. Show that if  $g \circ f = g \circ \tilde{f}$  and  $g$  is injective, then  $f = \tilde{f}$ . Is this statement true if  $g$  is not injective? Also, show that if  $g \circ f = \tilde{g} \circ f$  and  $f$  is surjective, then  $g = \tilde{g}$ . Is this statement true if  $f$  is not surjective?

This exercise introduces some cancellation laws for composition.

1. First, note that  $f$  and  $\tilde{f}$  have same domain and range, which is the first condition for two functions to be equal (by Definition 3.3.7). Then, suppose that  $g \circ f = g \circ \tilde{f}$  and  $g$  is injective. For the sake of contradiction, suppose that there exists  $x \in X$  such that  $f(x) \neq \tilde{f}(x)$ . Since  $g$  is injective, we would thus have  $g(f(x)) \neq g(\tilde{f}(x))$ , which would be a contradiction to the hypothesis  $g \circ f = g \circ \tilde{f}$ . Thus, there is no  $x$  such that  $f(x) \neq \tilde{f}(x)$ , or in other words,  $f = \tilde{f}$ .

This property is false if  $g$  is not injective. As a counterexample, one can think of  $f : \mathbb{R} \rightarrow \mathbb{R}$  with  $f(x) = x$ ,  $\tilde{f} : \mathbb{R} \rightarrow \mathbb{R}$  with  $\tilde{f}(x) = -x$ , and  $g : \mathbb{R} \rightarrow \mathbb{R}_+$  with  $g(x) = |x|$ .

2. As previously, first note that  $g$  and  $\tilde{g}$  have same domain and range. Let be  $y, y' \in Y$ . Since  $f$  is surjective, there exist  $x, x' \in X$  such that  $y = f(x)$  and  $y' = f(x')$  respectively. Since  $g \circ f = \tilde{g} \circ f$ , we have  $g(f(x)) = \tilde{g}(f(x))$ , i.e.  $g(y) = \tilde{g}(y)$ . We have showed that, for any  $y, y' \in Y$ , we have  $g(y) = \tilde{g}(y)$ , which means that  $g = \tilde{g}$ .

This statement is false if  $f$  is not surjective. For instance, let  $f$  be a constant function, e.g.  $f : \mathbb{R} \rightarrow \mathbb{R}$  with  $f(x) = 1$  for all  $x$ . Let  $g, \tilde{g} : \mathbb{R} \rightarrow \mathbb{R}$  with  $g(x) = 0$  and  $\tilde{g}(x) = -x + 1$ . We have  $g(1) = \tilde{g}(1)$ , i.e.  $g(f(x)) = \tilde{g}(f(x))$  for all  $x \in X$ , but we obviously do not have  $g = \tilde{g}$ .

EXERCISE 3.3.5. — Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  be functions. Show that if  $g \circ f$  is injective, then  $f$  must be injective. Is it true that  $g$  must also be injective? Show that if  $g \circ f$  is surjective, then  $g$  must be surjective. Is it true that  $f$  must be surjective?

1. If  $g \circ f$  is injective, then for any given objects  $x, x' \in X$ , we have  $g(f(x)) = g(f(x')) \implies x = x'$ . For the sake of contradiction, suppose that  $f$  is not injective. In this case, there exist two elements  $a, a' \in X$  such that  $a \neq a'$  and  $f(a) = f(a')$ . We would thus have  $g(f(a)) = g(f(a'))$  (axiom of substitution) and  $a \neq a'$ , which is incompatible with the hypothesis that  $g \circ f$  is injective.

Thus,  $g \circ f$  injective implies that  $f$  is injective.

However,  $g$  does not need to be injective. For instance, let's consider  $X = \{1, 2\}$  and  $Y = Z = \{1, 2, 3\}$ . Let's define the function  $f$  as the mapping  $f(1) = 1$ ,  $f(2) = 2$ . Let's define the function  $g$  as the mapping  $g(1) = 1$ ,  $g(2) = 2$ ,  $g(3) = 2$ . Here,  $f$  is injective, so is  $g \circ f$ , but  $g$  is not injective.

2. If  $g \circ f$  is surjective, then for all  $z \in Z$ , there exists  $x \in X$  such that  $z = g(f(x))$ . For the sake of contradiction, suppose that  $g$  is not surjective: then, there exists  $z \in Z$  such that for all  $y \in Y$ ,  $z \neq g(y)$ . In particular, for all  $x \in X$ , since  $f(x) \in Y$ , we would have  $g(f(x)) \neq z$ , which would be a contradiction with  $g \circ f$  surjective.

However,  $f$  does not need to be surjective. For instance, let's consider  $X = Y = \{1, 2\}$  and  $Z = \{1\}$ . Let  $f$  be the mapping  $f(1) = f(2) = 1$ , and  $g$  be the mapping  $g(1) = g(2) = 1$ . Here,  $g \circ f$  is surjective, but  $f$  is not.

EXERCISE 3.3.6. — Let  $f : X \rightarrow Y$  be a bijective function, and let  $f^{-1} : Y \rightarrow X$  be its inverse. Verify the cancellation laws  $f^{-1}(f(x)) = x$  for all  $x \in X$  and  $f(f^{-1}(y)) = y$  for all  $y \in Y$ . Conclude that  $f^{-1}$  is also invertible and has  $f$  as its inverse.

Recall that, by definition, for all  $y \in Y$ ,  $f^{-1}(y)$  is the only element  $x \in X$  such that  $f(x) = y$ .

1. Let  $a$  be an element of  $X$ , we thus have  $f(a) \in Y$ . Let's apply the definition to the element  $y = f(a) \in Y$ : by definition,  $f^{-1}(f(a))$  is the only element  $x \in X$  such that  $f(x) = f(a)$ . Since  $f$  is bijective, this implies  $x = a$ . We thus have proved that  $f^{-1}(f(a)) = a$ .
2. The proof for  $f(f^{-1}(y)) = y$  is similar.
3. To prove that  $f^{-1}$  is also invertible, we need to prove that  $f^{-1}$  is bijective, i.e. injective and surjective.

For any given  $y \in Y$ , since  $f$  is bijective, there exists exactly one  $x \in X$  such that  $y = f(x)$ . Similarly, for any given  $y' \in Y$ , there exists exactly one  $x' \in X$  such that  $y' = f(x')$ . In other words,  $f^{-1}(y) = x$  and  $f^{-1}(y') = x'$ . Suppose that  $f^{-1}(y) = f^{-1}(y')$ . This can be written  $x = x'$ , which necessarily implies  $f(x) = f(x')$  since  $f$  is a function (and by axiom of substitution). And this can also be written  $y = y'$ . We thus have proved that for any  $y, y' \in Y$ ,  $f^{-1}(y) = f^{-1}(y') \implies y = y'$ . Thus,  $f^{-1}$  is injective.

Furthermore, for any given  $x \in X$ , let's denote  $y = f(x)$ . Since  $f$  is bijective, this means that  $f^{-1}(y) = x$ . Thus, any  $x \in X$  has a predecessor  $y \in Y$  for  $f^{-1}$ , i.e.  $f^{-1}$  is surjective.

EXERCISE 3.3.7. — Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  be functions. Show that if  $f$  and  $g$  are bijective, then so is  $g \circ f$ , and we have  $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ .

The first point is an immediate consequence of Exercise 3.3.2. We just have to show that  $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ .

Let be any given element  $z \in Z$ . Since  $g$  is bijective, there exists one single element  $y \in Y$  such that  $z = g(y)$ , i.e.  $y = g^{-1}(z)$ . And since  $f$  is also bijective, there exists exactly one single element  $x \in X$  such that  $y = f(x)$ , i.e.  $x = f^{-1}(y) = f^{-1}(g^{-1}(z))$ .

Thus, for every  $z \in Z$ , there exists exactly one  $x \in X$  such that  $g \circ f(x) = z$ , and this element is  $f^{-1}(g^{-1}(z))$ . This means exactly that  $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ .

EXERCISE 3.4.1. — Let  $f : X \rightarrow Y$  be a bijective function, and let  $f^{-1} : Y \rightarrow X$  be its inverse. Let  $V$  be any subset of  $Y$ . Prove that the forward image of  $V$  under  $f^{-1}$  is the same as the inverse image of  $V$  under  $f$ ; thus the fact that both sets are denoted as  $f^{-1}$  will not lead to any inconsistency.

Since “ $f^{-1}(V)$ ” may refer to two different things here, let's first introduce some notations to avoid any confusion :

- Let  $F$  be the *forward image* of  $V$  under  $f^{-1}$ , i.e.  $F = \{f^{-1}(y) \mid y \in V\}$ .
- Let  $I$  be the *inverse image* of  $V$  under  $f$ , i.e.  $I = \{x \in X \mid f(x) \in V\}$ .

In this exercise we must show that  $F = I$ , so as to ensure that the two definitions of  $f^{-1}$  are equivalent. So, we will prove that  $F \subseteq I$  and  $I \subseteq F$ .

1. Let be  $x \in F$ . Thus, there exists  $y \in V$  such that  $x = f^{-1}(y)$ . By definition, this is equivalent to  $f(x) = y$ . But since  $y \in V$ , we can say that  $f(x) \in V$ . Thus, we have both  $x \in X$  (because  $F \subseteq X$ ) and  $f(x) \in V$ , which means that  $x \in I$ .
2. Conversely, let be  $x \in I$ . By definition, this means that  $x \in X$  and that  $f(x) \in V$ , i.e. there exists a certain element  $y \in V$  such that  $y = f(x) \in V$ . This latter statement is equivalent to  $x = f^{-1}(y)$ . Thus, we have  $x \in X$  and  $x = f^{-1}(y)$  for a certain  $y \in V$ , which means that  $x \in F$ .

EXERCISE 3.4.2. — Let  $f : X \rightarrow Y$  be a function, let  $S$  be a subset of  $X$  and let  $U$  be a subset of  $Y$ . What, in general, can one say about  $f^{-1}(f(S))$  and  $S$ ? What about  $f(f^{-1}(U))$  and  $U$ ?

This exercise gives a first taste of Exercise 3.4.5 below.

1. First consider  $f^{-1}(f(S))$  and  $S$ .
  - Do we have  $f^{-1}(f(S)) \subset S$ ? Generally, no. As a counterexample, let's consider  $f(x) = x^2$  with  $X = Y = \mathbb{R}$  and  $S = \{0, 2\}$ . We have  $f^{-1}(f(S)) = f^{-1}(\{0, 4\}) = \{-2, 0, 2\}$ . In this set, we have an element,  $-2$ , which is not an element of  $S$ .
  - Do we have  $S \subset f^{-1}(f(S))$ ? Yes. Let be  $x \in S$ . Then, by definition,  $f(x) \in f(S)$ . So,  $x \in X$  and is such that  $f(x) \in f(S)$ : this is precisely the definition of  $x \in f^{-1}(f(S))$ .
  - Conclusion: generally speaking,  $S$  and  $f^{-1}(f(S))$  are not equal, but  $S \subset f^{-1}(f(S))$ .
2. Now consider  $f(f^{-1}(U))$  and  $U$ .
  - Do we have  $U \subset f(f^{-1}(U))$ ? Generally, no. As a counterexample, let's consider  $f(x) = \sqrt{x}$  with  $X = \mathbb{R}_+$ ,  $Y = \mathbb{R}$  and  $U = [-1, 1]$ . We have  $f(f^{-1}(U)) = f([0, 1]) = [0, 1]$ , which is clearly not a subset of  $U$ .
  - Do we have  $f(f^{-1}(U)) \subset U$ ? Yes. Let be  $y \in f(f^{-1}(U))$ . By definition, there exists  $x \in f^{-1}(U)$  such that  $y = f(x)$ . But if  $x \in f^{-1}(U)$ , we have  $f(x) \in U$ . And since  $y = f(x)$ , this means that  $y \in U$ .
  - Conclusion: generally speaking,  $U \neq f(f^{-1}(U))$ , but  $f(f^{-1}(U)) \subset U$ .

EXERCISE 3.4.3. — Let  $A, B$  be two subsets of  $X$ , and let be  $f : X \rightarrow Y$ . Show that  $f(A \cap B) \subseteq f(A) \cap f(B)$ , that  $f(A) \setminus f(B) \subseteq f(A \setminus B)$ , and  $f(A \cup B) = f(A) \cup f(B)$ . Is it true that, for the first two statements, the  $\subseteq$  relation can be improved to  $=$ ?

Let's prove the three statements successively:

1. If  $y \in f(A \cap B)$ , then there exists  $x \in A \cap B$  such that  $f(x) = y$ . Since  $x \in A \cap B$ , we have both  $x \in A$  and  $x \in B$ , which implies  $y = f(x) \in f(A)$  and  $y = f(x) \in f(B)$  respectively. Thus,  $y \in f(A) \cap f(B)$ , and we have proved that  $f(A \cap B) \subseteq f(A) \cap f(B)$ .  
However, the converse inclusion is false in general. For instance, let's consider the two sets  $A = \{1, 2\}$ ,  $B = \{2, 3\}$  and the (non injective) function  $f$  defined as the mapping  $f(1) = 1$ ,  $f(2) = 2$ ,  $f(3) = 1$ . We have  $f(A) = \{1, 2\}$ ,  $f(B) = \{1, 2\}$ , thus  $f(A) \cap f(B) = \{1, 2\}$ . This is not a subset of  $f(A \cap B) = f(\{2\}) = \{2\}$ .

2. If  $y \in f(A) \setminus f(B)$ , then there exists  $x_0 \in A$  such that  $y = f(x_0)$ , but we have  $f(b) \neq y$  for all  $b \in B$ . Suppose that  $x_0 \in B$ : in this case,  $f(x_0) \neq y$ , a contradiction. Thus,  $y = f(x_0)$  with  $x_0 \in A \setminus B$ , which proves that  $f(A) \setminus f(B) \subseteq f(A \setminus B)$ .

However, the converse inclusion is false in general. For instance, let's consider the two sets  $A = \{1, 2, 3\}$ ,  $B = \{3\}$  and the function  $f$  defined as the mapping  $f(1) = 1$ ,  $f(2) = 2$ ,  $f(3) = 1$ . We have  $f(A \setminus B) = \{1, 2\}$  but  $f(A) \setminus f(B) = \{2\}$ .

3. If  $y \in f(A \cup B)$ , then there exists  $x \in A \cup B$  such that  $y = f(x)$ . If  $x \in A$ , then  $f(x) \in f(A)$ , which implies  $x \in f(A) \cup f(B)$ . There is an identical result if  $x \in B$ . Thus,  $f(A \cup B) \subseteq f(A) \cup f(B)$ .

Conversely, if  $y \in f(A) \cup f(B)$ , then we have either  $y \in f(A)$  or  $y \in f(B)$  (or both). In the first case, there exists  $x \in A$  such that  $y = f(x)$ . But since  $x \in A$ , we also have  $x \in A \cup B$ , so that  $y \in f(A \cup B)$ . The same result holds if  $y \in B$ . Thus, in both cases,  $y \in f(A \cup B)$ .

EXERCISE 3.4.6. — Prove lemma 3.4.9. (Hint: start with the set  $\{0, 1\}^X$  and apply the replacement axiom, replacing each function  $f$  with the object  $f^{-1}(\{1\})$ .)

First, let's recall the main propositions involved in this exercise:

- **Replacement axiom.** Let  $A$  be a set. For any object  $x \in A$ , and any object  $y$ , suppose we have a statement  $P(x, y)$  pertaining to  $x$  and  $y$ , such that for each  $x \in A$  there is at most one  $y$  for which  $P(x, y)$  is true. Then there exists a set  $\{y \mid P(x, y) \text{ is true for some } x \in A\}$ , such that for any object  $z$ ,

$$z \in \{y \mid P(x, y) \text{ is true for some } x \in A\} \iff P(x, z) \text{ is true for some } x \in A$$

- **Power set axiom.** Let  $X$  and  $Y$  be sets. There there exists a set, denoted  $Y^X$ , which consists of all the function from  $X$  to  $Y$ :

$$f \in Y^X \iff (f \text{ is a function from } X \text{ to } Y)$$

- **Lemma 3.4.9.** Let  $X$  be a set. Then the set  $\{Y \mid Y \text{ is a subset of } X\}$  is a set.

The aim is to prove this lemma using the two axioms recalled here.

1. Let  $X$  be a set, and  $Y = \{0, 1\}$ . Per the power set axiom,  $\{0, 1\}^X$  is a set, and it contains all the functions  $f : X \rightarrow \{0, 1\}$ .
2. Let  $A$  be a subset of  $X$ . One can define the function  $f_A : X \rightarrow \{0, 1\}$ , such that for all  $x \in X$ ,  $f_A(x) = 1$  if  $x \in A$ , and  $f_A(x) = 0$  otherwise. We can even say more:
  - If  $A$  is a subset of  $X$ , then there exists an element  $f \in \{0, 1\}^X$  such that  $A = f^{-1}(\{1\})$ : this is precisely  $f_A$  as defined above.
  - Conversely, if  $f \in \{0, 1\}^X$ , then  $f^{-1}(\{1\})$  is by definition a subset of  $X$ .

Thus, the two statements “ $A$  is a subset of  $X$ ” and “there exists  $f \in \{0, 1\}^X$  such that  $A = f^{-1}(\{1\})$ ” are equivalent.

3. Finally, let be  $A \subset X$  and  $f \in \{0, 1\}^X$ . Let's define  $P(f, A)$  the statement " $A = f^{-1}(\{1\})$ ". For each  $f$ , there is at most one  $A$  (in fact, *exactly* one  $A$ ) such that  $P(f, A)$  is true. Thus, per the axiom of replacement, there exists a set:

$$\mathcal{P} = \{A \mid A = f^{-1}(\{1\}) \text{ for some } f \in \{0, 1\}^X\}$$

And, thanks to the equivalence demonstrated in 2.:

$$\mathcal{P} = \{A \mid A \text{ is a subset of } X\}$$

is a well-defined set, which we wanted to prove.
